

Having worked in the RF/Electronics field for several years now, I can see nothing but bad things coming from BPL. Not only will it be impossible to keep the broadband signal inside the power grid (even with Part 15 compliance), it will also be impossible to prevent the licensed users signals from disrupting the digital ones. A licensed mobile user running 100W on HF could potentially knock out a dozen city blocks of internet traffic. Furthermore, as a licensed user of the spectrum, I find it totally unacceptable to have to endure S9+20dB signals of white noise and digital chatter on top of the already rough natural noise floor. Please deny the use of BPL.

Thank You
